

Project Architecture Document

APS Fault Detection System

Table of Contents

- Project Architecture Document
 - 1. Introduction
 - 2. System Architecture
 - 3. Communication Protocols
 - 4. Technologies and Frameworks
 - 5. Project Deployment
 - 6. Conclusion

1. Introduction

The Project Architecture Document provides an overview of the overall architecture and design considerations for the APS Fault Detection System. It outlines the key components, their interactions, and the technologies used in the system.

2. System Architecture

The project follows a modular and layered architecture to ensure modifying-ability, scalability, and maintainability. The major components of the system architecture include:

1. **User Interface (UI):** The UI component handles user interactions and provides a user-friendly interface for inputting required information and getting predictions.
2. **Application Layer:** The Application Layer serves as the intermediary between the UI and the backend components. It processes user inputs, performs data validation, and orchestrates the flow of information.
3. **Back-End Services:** The Back-End Services encompass various functionalities required for the prediction process, such as data ingestion, data transformation, data validation, model training, and model prediction.
4. **Machine Learning Model:** The Machine Learning Model component is responsible for predicting the Sensor Fault Status based on the input data. It utilizes trained models, algorithms, and statistical techniques to make accurate predictions.
5. **Data Storage:** The Data Storage component stores the input data, predictions, and other relevant information. It can include databases, file systems storage solutions.

3. Communication Protocols

To enable smooth communication and data flow between the system components, the following protocols can be employed:

- **HTTP/HTTPS:** Used for communication between the UI, Application Layer, and Back-End Services.

- **Database Protocols:** Facilitate data storage and retrieval operations between the Back-End Services and the Data Storage component.

4. Technologies and Frameworks

This project utilizes the following technologies and frameworks:

- **Front-End:** HTML, CSS, Bootstrap and Jinja2 templates for building the user interface.
- **Back-End:** Python as the primary programming language for implementing the Application Layer and Back-End Services.
- **Web Framework:** Flask for building the application server and handling HTTP requests.
- **Machine Learning:** Python library **scikit-learn** for implementing the Machine Learning Model.
- **Data Storage:** NoSQL databases i.e MongoDB for storing data.
- **Data Processing:** Python libraries like **pandas**, **numpy**, **imblearn** for data manipulation.
- **Data Visualization:** Python libraries like **matplotlib**, **seaborn**, **pandas** to visualize the data using python.

5. Project Deployment

This project is deployed on AWS using Beanstalk.

6. Conclusion

The Project Architecture Document outlines the architecture and design considerations for the project. It highlights the key components, their interactions, and the technologies used in the system. This document serves as a reference for the development team, guiding the implementation and ensuring the system's modifying-ability, scalability, and maintainability.
